

# Minicoral

Blacken the left, the right, the top or the bottom half of every cell. The blackend areas have to be connected vertically or horizontally and no  $2 \times 2$  block of quarters may be completely black. All white quarters have to be connected to the edge of the diagram. This results in a coral. In some quarters there is a number. These quarters may not be blackend and the numbers give the number of cells in the corresponding white area.
